Book Descriptions:

733 dewalt planer manual

It comes with two resharpenable blades, while its successor, the DW734, uses three disposable blades instead. The dust port is made from plastic and bolted onto the machine. Due to its design wood chips often clog up in the left part, meaning you have to completely unscrew it again to clean it. On the bigger DW735, DeWalt actually added a blower to spit the chips out so they can't get stuck. Add it here We have the answers. Gives a good first impression of the machine. He even makes a clever jig for sharpening the blades. Shows how to replace bearings and plates. The 734 uses three disposable blades, while the 733 uses two resharpenable blades. On most machines I know those will have quite different shapes different slots to secure them. So it is unlikely that they can be used on both machines. Let us know through this form. Also there is a video showing how to overcome the problem of the dust port clogging up. Enter the quantity for each part you wish to purchase. We have 2 DeWalt DW733 manuals available for free PDF download Manual, Instruction Manual. Login to post Bcause Ive bought it from various websites so I know how each site deals. try www.reliablestore.com. Very helpful Good Luck! Their are two Types of the DW733 so select the one you have and download the PDF you need. However, to replace the blades 1. Remove handle 2. Remove cover 3. Remove screws that hold binder to the blade. 4. Lift out blade, be careful not to cut yourself, extremely sharp 5. Replace in reverse order Hope that helps. Handie Andie Type 1 I know for sure will come up, I have looked at it a couple times. The manual is 30 pages long. Kindle Customer 2.0 out of 5 stars After a few uses, they began to chatter the wood until ultimately I replaced them with original Dewalt blades. I then used the planer knife gauges to reset the knives and the planer then ran smoothly, no sniping. Installation error. I replaced them with these and it works great. I cant speak for how they compare to OEM blades but theyre razor sharp and make little work of my first project. As expected! It came quick even with the pandemic. Really

Gloves should be worn for handling the blades while carrying out this procedure. Quick, accurate surface planing depends on the DeWalt 733s hardened steel blades. When the blades need to be changed, the procedure common to all DeWalt planers is easy to complete. Only loosen the set screws about a halfturn counterclockwise to free the cutting blade. It is neither necessary nor recommended that the set screws be removed for this procedure. Caution should be used in handling the old and new cutting blades to avoid injury from their extremely sharp edges. Make certain the beveled side of the cutting blades edge is upward and facing the rear of the saw body. I began installing the blades Sunday evening and the inner bolts would not go in. There was no way the inner bolts would line up. I contacted the company and Amazon, which is where I was given no hassle and returned the blades to which I received the new blades today. The new blades matched up perfectly and work great. Hopefully time will tell how well the blades will hold up in the long run compared to the Dewalt blades. Sorry, we failed to record your vote.

Please upgrade your browser to improve your experience. I love the planer, but I would love it even more if the blades were much cheaper. Jack Its blades can be resharpened and I have a friend whos shop includes a surface grinder. He charges me 10 or 15 bucks U.S. and even made a fixture to simply his work. BUT, I dont know if the blades of the 735 can be resharpened. I wish I could offer more help. For some reason, the dealer Woodworkers Warehouse now defunct gave me an extra third! set when I bought the planer. Maybe he liked me. I must be overtired. MY planer is a 733, not a 734, and your is not a 735, it is a 734 as you say. I am alllll conphoosed. Have you checked in with Freud The tool maker, not the shrink. Anyone have any insight on this Its clever and it works. The precision I was referring to is the blade width and the location and height of the mounting holes theyre incredibly precise. So long as the distance is consistent amongst the 9 nine holes, you can be pretty sure that the freshly honed set will work as if they were new.

Out of the DeWalt shop why did they decide all of a sudden these couldnt be resharpened like many of their other blades When the cost to manufacture a disposable blade falls below a certain point, then buying a new disposable blade is cheaper than having a conventional blade resharpened. Maybe thats an incorrect assumption. I am long retired, on a semi mostly fixed income and I dont plan to part with my DW733. I dont know if the mounting mechanism will tell you much. It might however be helpful in some way to others here. I just bought about 100bf of nice, airdried, roughsawn cherry, fer instance, with more to come. And I still have some BIG slabs of walnut from a tree my Dad and I cut down fifty years ago. I was a late starter in this woodworking thing. You dont need all of it I decided on 40 knowing that the steeper angle would cut well but dull sooner but with three blade sets and a helpful friend, why not The blades are held by fitting over 3 posts in each blade location naturally, there are 3 holes in the disposable blades. Its those holes that provide the correct cutterhead alignment they are very precisley located in the center of the blade. The slop in those holes is all in the direction paralell with the length of the blade, which allows you to shift a knife thats gotten a chip in it. I guess they call this progress. For a while I lamented this fact. No more now because I am very happy with the 733 and the fact that my friend charges only ten bucks per set to sharpen the blades and these blades are beefy enough to last for years and years. The blower on that thing is NICE. I simply have my 735 hooked to a 55 gallon trash can and it works like a

charm. Does your 733 have that feature I am however, since seeing it mentioned here in Knots, seriously considering adding a version of the Dust Deputy. In fact I usually use it only to clean the Feins felt filter or to suck up the dead leaves out of the cellar staircase.

All around my shop were pieces of the blade and the housing unit. Apparently when I flipped the blades over to be used I forgot to put one screw back into the bracket that holds them in. This one missing screw caused the bracket to bend and was literally ripped apart by the high rpms produced by the unit. The rest lets just say was a scary mess. See the attached. Since theyre reversible, I figure I got my moneys worth with 6 fresh edges and its probably time to buy a new set. The upgrade is pricey, and itd really stink to do that to my DJ20 and then not be able to get the inserts in a few years. I do so, and it doesnt seem to negatively affect the performance in any meaningful way. Its important to use the same number of strokes on each blade clean any resin off with kerosene or laquer thinner first!, so I count them out. Again, I use the same number of strokes on all blades so that I dont accidentally hone one narrower than the others. About 10 strokes is required to get them razor sharp. I dont worry about removing nicks, because doing so would alter the blade geometry enough to potentially cause performance issues I just shift the knives in their mounting slots slightly so that knicks dont show up on the wood surface. Was gleich auffällt ist auch die Schneide hat Reste vom Schleifgrat, aber das kann man noch beheben, wenn man die Messer fein abzieht. Was mir aber nicht gefällt, die Messer werden recht schnell stumpf und ein zu Hilfe gezogener Fachmann prüfte die Harte, das sind nur 59 HRC. Gute HSSMesser sollten eine Harte um die 65 HRC haben. The manual isnt much help. Any ideas on how to save the cutting board would be greatly appreciated too. Does anyone have a solution for this. Are they all sticking out of the holders an equal distance. Is this common with planers after a blade swap.

Is it possible the blades have worn down in the center, causing less material to be removed there. I usually keep my boards a little long to combat that. Then trim off the sniped part.
