Because if it seems the odds are high that the board is fried, that's just throwing good money after bad, and I have no other use for a 1kw PSU. But if the odds look more favorable, at some point the gamble becomes worth it. This is not my primary working machine, and nothing valuable is at risk other than 12-year-old hardware. However, there's some emotional attachment, as I've fiddled with it endlessly, including upgrades to 32gb RAM, the fastest supported CPUs, GPUs, etc. It ran like a champ in a 4U rackmount server chassis. I recently downsized the system to a smaller desktop EATX case and just a single boot SSD. <http://www.infotechsystemsonline.com/ital/www/img/dynare-manual-estimation.xml>

Unbeknownst to me at the time, sometime during the last 12 years, the fan in the 1,200 watt PSU died. The only reason the system ever worked at all, is because one of the massive CPU cooler fans was doing the job for the PSU fan, an inch away and directly over the PSU fan intake. Yes, a terrible case layout for this particular board. While burning the system in to make sure the transplant was successful, the PSU apparently overheated. So, hoping this was also the case now, I tried resurrecting the system with a new 750 watt PSU I have on hand. The POST LED readout doesn't turn on, no fans, nothing else happens. Although, one time just once the southbridge fan and other LEDs briefly, for maybe half a second, turned on. I could never get that to repeat. But gives me some hope. Like I said before, the maximum I've ever seen this system pull from the wall is 450 sustained watts. While installing the PSU I also installed a second CPU power cable from Amazon. Didn't help. It will normally power up without those, just won't get past POST. My speculation would make a horrible answer. It actually has both CPU power cables, one of which I had to order separately. I'll update the question to make that clear. Not a 750watt below mfg recommendation, and not 1200 above. But everything except for the PSU was fine, and a new PSU revived it. That's why I held out hope the same might be true this time. The only way to find out is to buy a new motherboard. I've found some workstation and server mobos with similar chipsets and specs, but even used they are still very pricey. I had really grown fond of it. Please be sure to answer the question. Intel markets desktop boards into the retail channel and to various computer manufacturers known as OEMs original equipment manufacturers. These OEMs may further customize the desktop boards to their own specifications. OEMs may also integrate the desktop boards with other system components such as a power supply, disk drive, software, and chassis. For this reason, Intel cannot support a desktop board distributed by an OEM. You should contact the OEM directly or the place where you purchased your system for support. The OEM or the place of purchase will be most familiar with your configuration and its integration of both hardware and software. Important NotesThe Readme file includes BIOS update instructions for advanced users. Update the BIOS on your computer only if the newer BIOS version specifically solves a problem you have. We do not recommend BIOS updates for computers that do not need it. You can view all new BIOS fixes in the Release Notes. Before initiating a BIOS update, be sure to read and precisely follow the instructions included in the Readme. You may wish to print the instructions for easy reference. If a BIOS update process is interrupted, your computer may not function properly. We recommend the process be done in an environment with a steady power supply preferably with UPS. For tips on troubleshooting BIOS issues on Intel Desktop Boards, refer to Troubleshooting BIOS Issues. In the unlikely event that a BIOS update is interrupted, it is possible the BIOS may be left in an unusable state. Use the Recovery BIOS update to recovering from this condition. It requires a blank floppy diskette or CD. It requires a CD or a USB flash device.

The primary difference between Skulltrail and Intels current and past enthusiast chipsets is a dual CPU socket design that allows two processors to operate on the same motherboard. Therefore, Skulltrail can operate eight processing cores on one system. The platform supports two Core 2 Extreme QX9775 processors commonly mistaken for the Core 2 Extreme QX9770, which is the LGA775 counterpart, which operate at 3.2 GHz. It achieves this by including two NVIDIA nForce 100 PCIe 1.1 switch two x16 to one x16 chips. The implementation of SLI supports Quad SLI technology, which is achieved through the use of two dualGPU graphics cards from NVIDIA, including the GeForce 9800 GX2. This gives a total of four graphics processors. Owners of Skulltrail systems can also make use of up to four ATI graphics cards using ATI CrossFireX technology, which made SkullTrail the only platform other than Intel X58 and P55 Chipset to support both SLI and CrossFire with public drivers at the time of release. The HP Firebird 803 also supported SLI on one proprietary, MXM motherboard at the time, but the drivers were special and only available for Firebird hardware. Then on October 22nd, 2007, the two processors were demonstrated running at 4.4 GHz with water cooling. They were demonstrated again on October 31, 2007, this time running at 5.

0 GHz, with phase change cooling. On April 18, 2008 Toms Hardware, reporting from an Overclocking Enthusiast site, reported that an overclocked speed of 6.006 GHz was achieved on an 8core Skulltrail setup. This is in part due to the lack of support for multicore computing with many popular game engines at the time, in addition to the extremely high price of the components involved. Computers based on the Skulltrail platform also require highoutput power supplies for both the CPU and graphics cards, along with a computer chassis capable of accommodating the motherboard, which is based on an Extended ATX form factor design. The Skulltrail D5400XS motherboard is now just one of the motherboards available, along with motherboards with X58 and P55 chipsets, that runs both nVidias SLI and ATIs Crossfire platforms out of the box with public hardware drivers.
