The Standard Range undercounter machines are produced to the highest standard but with a budget firmly in mind. With an emphasis on reliability, ease of operation and excellent washing results, these glasswashers will keep washing time after time at a price you can afford. Clear Add to basket Add to Wishlist Add to Wishlist Compare Description Additional information Accessories Description DC SG40 IS Standard Glasswasher with Integral Softener, 400mm Basket 18 pint The DC SG40 IS Standard Glasswasher with Integral Softener, 400mm Basket 18 pint is a quality compact glasswasher from the Standard Range of DC, specifically engineered with a doubleskinned stainless steel cabinet and door to improve strength, thermal acoustic insulation and reduce overall running costs. The DC Standard Range of glasswashers are ideal for those wishing to combine efficiency with superb product quality. All models within this range can be outfitted with a plethora of addons, such as an optional drain pump, integral water softener or cold rinse. 1 years parts only warranty is standard with this model.

Option of 1 years parts and labour warranty is available at an additional cost. Please select your option at checkout. SG40 IS Product Features Energysaving wash pump Doubleskinned stainlesssteel cabinet and door Low water usage EasyClean filters Removable antiblock wash and rinse arms Hydrodynamic basket slides Optional thermostop for guaranteed rinse temperatures Integral detergent and rinse aid dosing units Simple, intuitive controls Supplied with 2 glass baskets Specifications Dimensions W460 x D515 x H630mm 18 pint capacity 2 filters Cycle time of 2 minutes Wash tank capacity 14Ltr Water consumption 2.4Ltr Waste outlet diameter 25mm Waste height 120mm Standard 13 amp plug Required water pressure of 24 bar 2856 psi. Usable wash height 260mm Machine drain height 120mm Basket size 400 x 400mm Weight of 36kg 1 year parts only warranty Water Softener All ware washing machines require a softener if in a hard water area. By having an external or internal softener fitted to your machine you will greatly improve your washing results, reduce running costs and increase the life expectancy of your product. Drain Pump A drain pump is required when the waste services are higher than the drain outlet of the machine. Break Tank Type A break tanks should be fitted to machines that are to be used as commercial dishwashers and connected to the mains water supply. Generally, businesses rated at category 5 or higher will include any highrisk areas such as Schools, Care Homes, Nurseries or Hospitals where contamination of the water supply would be detrimental to hygiene and health. Boost Pump If you have low water pressure consider purchasing an internal or external rinse booster pump. Faulty installation, commissioning, misuse, or user related problems are not covered under warranty. Electrical appliances MUST be installed by a qualified electrician. A warranty call out will not be instigated without the name of the installing engineer.

This chip has 4.29 gross MP, with 2.74 effective MP in 169 with image stabilization on, 2.99 effective MP in 169 with the image stabilization off, and 3.5 effective MP in 43. Every color was strong but not oversaturated. The contrast was excellent, as well, with dark blacks and bright whites. The picture was not the sharpest, however. Most of its edges show some serious artifacts, probably due to bad compression. Diagonal and curved lines show a lot of stairstepping. These problems are at least as bad as those in the Sony DVD405, which we complained about in that review.

Noise was much worse than in the DVD405 and appeared to flare up around any areas of contrast. Note, in the zoomed image below, the noise that appears along the dotted line on the left and the sides of the resolution trumpets. The DVD405 has more apparent sharpness than the DC40, but the stronger contrast between black and white makes the jaggies more visible in the DVD405. Color balance was about the same, but the colors were slightly less vivid. Its picture was also less sharp, though it did not have the artifacts that appeared in the DC40. In 43 aspect ratio, the DC40 produced 455.9 lines of horizontal resolution and 284.3 lines of vertical resolution, yielding an approximate total of 129612.37. In 169 aspect ratio, the camcorder produced 476.4 lines of horizontal resolution and 302.4 lines of vertical resolution, yielding an approximate resolution of 144063.36. The main problem was brightness. Noise did not increase significantly. Color balance did not fail that is to say, auto gain did not skew certain colors. But the colors, which were vivid at 3000 lux, fail to pop at 60 lux. This seems to be a result of strong gain, but the camcorder was able to keep the noise in check. The entire picture was brighter, overall, as well. This is, in part, probably related to the difference in chip size, but the new DC40 also seems to have slightly higher saturation

levels. The Panasonic VDRD300, with three small CCDs, did not have a bright image at all, not did color distinction look that good. This allows you to shift the shutter speed while the camcorder automatically adjusts the other exposure controls. While this setting would tend to blur fast moving objects, the blur would not be overwhelming. This is very disappointing for a chip of this size. The Sony DVD405 managed to push some colors through, thanks to heavy saturation. At this light level, it's probably better to have some color rather than accurate color. The Canon DC20 was much darker, almost greyscale.

The Panasonic VDRD300 produced strong greens, but most of the other colors failed to show through. Although we expected to see the same type of successful results found with Canon's MiniDV camcorders, we were surprised to find otherwise upon testing. The Canon DC40 was tested in both 169 and 43 formats and, with both, this camcorder produced a 47 degree field of view. Unfortunately, the DC40 engages a crop and zoom technique that eliminates information from the top and bottom of an image when switched from 43 to 169. This cropping technique is actually the exact opposite of what should occur in 169 format. These qualities correspond to the maximum bit rate or the amount of data per second. XP likely records at the maximum bit rate for DVD compression, 9Mbps. The SP mode has a maximum of 6Mbps, and LP mode has a maximum of 3Mbps. This means that the data rate goes up or down according to the amount of motion in the image from second to second. If there is little motion, the camcorder will refresh the pixels less frequently, thereby saving space and energy. If the image is constantly moving, the camcorder must increase the data rate. In XP mode, a standard DVD will hold about an average of 20 minutes of video. SP mode holds 30 minutes, and LP holds 60 minutes. Of course, more goes into good compression than just bit rate, but it is a major factor. There are also two methods of finalizing the video Video mode and VR mode. Video mode allows playback on most DVD players, but makes the discs forever after uneditable on the camcorder of course, you can still edit it on your computer. VR mode gives you more incamera editing flexibility which is an overrated feature anyway, but will render the footage unreadable by many home DVD players. These are the two most popular formats for DVDs, and you'll have no trouble finding them. Panasonics and Hitachis both accept DVDRAM, which gives you more incamera editing capabilities but cannot be read by many home DVD players.
