

## 2.3.2.2 Ink Tank Unit

### 2.3.2.2.1 Structure of Ink Tank Unit

**1) Ink tank**  
Each color-specific ink tank is filled with 130 mL of ink (90 mL for the starter ink tanks furnished with the printer). The ink level in each ink tank is monitored by EEPROM attached to the tank and is detected as a bit count on the basis of the EEPROM information. When an electrical switch in a hollow needle detects an abnormality, it displays a message reporting that the ink tank is nearly empty. If the bit count reaches a preprogrammed value in this state, an ink bit condition is assumed.

**2) Ink port**  
Depressing the ink tank four lever on the printer would cause a hollow needle to pierce the ink port sealed by a rubber plug, linking the ink passage of the ink tank to the printer.

**3) Air passage**  
Depressing the ink tank four lever on the printer would cause an open hollow needle to pierce the air passage sealed by a rubber plug, releasing the internal pressure of the ink tank to large atmosphere.

**4) Notches for preventing incorrect installation**  
Ink tanks are furnished with notches for preventing incorrect installation. If the installation of an ink tank in incorrect position is attempted, the notch would interfere with it, preventing its installation.

**5) Agitating plate**  
The ink tank four lever won't lower without the ink tank fully inserted to reach the mounting position, so the ink cannot be supplied.

**6) Agitating plate**  
Assists in the agitation of pigment inks during ink agitation carried out to prevent their settlement.

## Book Descriptions:

We have made it easy for you to find a PDF Ebooks without any digging. And by having access to our ebooks online or by storing it on your computer, you have convenient answers with canon ipf700 manual pdf . To get started finding canon ipf700 manual pdf , you are right to find our website which has a comprehensive collection of manuals listed.

Our library is the biggest of these that have literally hundreds of thousands of different products represented.

## Book Descriptions:

# canon ipf700 manual pdf

In the event of major changes in the contents of this manual over a long or short period, Canon will issue a new edition of this manual. Indicates an item requiring care to avoid electric shocks. Indicates an item requiring care to avoid combustion fire. Indicates an item prohibiting disassembly to avoid electric shocks or problems. In the diagrams, represents the path of mechanical drive; where a signal name accompanies the symbol, the arrow indicates the direction of the electric signal. It has 5,120 nozzles for MBK and 2,560 nozzles for each additional color arranged in a zigzag pattern. If print quality remains unimproved even after a specified cleaning operation, replace the printhead. Replacement about one year after the date of initial unpacking is also recommended. Equipped with casters so that the printer can be easily moved. The output stacker included with stand can use by the two ways of the regular position or extended position. INITIALIZING ONLINE PRINTING MAIN MENU OFFLINE PAUSE Key operations and print commands SLEEP SUB MENU 1 Sec. Standard Adj. Advanced Adj. Auto Print Manual Head Adj Auto Band Adj. Standard Adj. When mounting the printhead on the printer, remove protective caps 1 and 2 in this order by holding them by the lugs. To prevent possible damage to the nozzle section, do not replace protective cap 2 on the printhead once it has been removed. When placing an ink tank in position, shake it slowly seven to eight times before opening it. Without shaking, the ingredients of the ink might settle, resulting in degraded print quality. If the power cord is disconnected from the wall outlet or the top cover or any other cover is opened, the printer cancels the ongoing operation and shuts down immediately. Print position adjustment work in two modes automatic adjustment, in which print position adjustment patterns printed are detected by a multisensor attached to the lower left part of the carriage, and manual adjustment, in which print position adjustment patterns that are slightly modified from one another are printed, so that visually verified adjustment values can be set from the operation panel. Consisting mainly of a carriage unit that houses ink tanks and a printhead, and a maintenance cartridge, the ink passage supplies, circulates, sucks and otherwise handles inks. It supplies, circulates, sucks and otherwise handles inks. The ink passage per color is schematically shown below, along with the ink flow. The ink level in each ink tank is memorized in EEPROM attached to the tank and is detected as a dot count on the basis of the EEPROM information. The carriage relay PCB is connected to the main controller by a flexible cable. When the printhead is secured to the carriage, the signal contact of the head relay PCB is pressed against that of the printhead to convey print signals. Further, the ink passage from the ink tanks is connected to the printhead via the ink tubes. Wiping is executed in sync with the rotation of the motor. Wipers

mounted on the carriage wipe the printhead while the carriage is halted at its home position. <http://www.dilipprabhavalkar.com/images/ibm-thinkpad-t43-manual.xml>

A maintenance jet is discharged as the carriage travels to pass the maintenance jet tray to the right of the plant. Capable of controlling each nozzle individually, the printhead implements discharge control for six colors by itself. Functions provided by the purge unit include capping, cleaning and ink supply. The part of the caps that comes into contact with the face plate of the nozzle assembly is made of rubber. A pair of two wiper blades are installed to ensure wiping performance. The wiping operation operates on a slide wiping basis, sliding the wiper blades via wiper cams through the rotation normal of the purge motor. Wiping is executed by the wiper blades moving at a constant speed to the front of the printer after the end of a print or suction operation. Paper is fed horizontally under the printhead on the carriage as it is kept level on the platen to prevent heaving. It supports the following functions Image processing unit This unit converts the RGB multibit image data or CMYK multibit data received from the host computer through the interface connector to the binary image data for the ink colors used. When the upper cover closes, the switch is pressed to detect the closed state of the cover. The status of the purge unit, such as capped, suction, and wiping, is detected in a combination of the status of detection by the pump cam sensor and the control of purge motor rotation by the pump encoder sensor. The sensor detects that the ink supply valve is open when the sensor light is shielded by a link interlocked with the valve cam. Ink detection sensor The ink detection sensor detects the presence or absence of the ink in an ink tank with respect to the status of continuity between two hollow needles. The sensor detects the presence of paper when it receives sensor light reflected upon the paper.

Feed roller HP sensor The feed roller HP sensor sets an LF eccentricity correction home position by detecting transitions from black shielded to white transmitted, or a reference, in the scale in the code wheel. In spite of this precaution, shocks incurred during transportation can damage the printhead. Print the nozzle check pattern before making preparations for transporting the printer, print the nozzle check pattern again after installing the printer at the new location, and then compare the two printouts. When installing the printer after moving it on the same floor having a steps If you have moved the printer to the installation site on the same floor having a steps with ink drained, install it again in the same manner as that for initial installation after reception of the delivered printer. The carriage is not movable while it is capped. In this case, uncap the printer before moving it. Next, detach the right cover by lifting it up as a whole. F410 f. F418 8 Remove the printhead. F420 13 Release the ink tube unit from the carriage. b. Reassembling the ink tube unit When the ink unit has been replaced, turn on the power switch without the printhead and the ink tanks mounted. Then, mount the printhead and ink tanks as directed by message guidance to fill the tanks. When the ink is drained, the ink inside the ink passage totaling approximately is drained as waste ink. To prevent ink leaks, be sure to always remove the ink inside the ink passage when disassembling or transporting the parts of the ink passage section. Smear the grease lightly and evenly with a flat brush. Don't apply the grease to locations other than those designated. Unwanted grease may cause poor print quality, take particular care that grease does not get onto the wiper, cap, or the linear scale. Warnings and errors are displayed on the printers LCD along with a code comprising alphanumeric characters. 2.

Improper connection of connector, defective power connector, defective power supply PCB, defective operation panel, or defective main controller PCB. If the media type is different from that required by the send data, no media is loaded, or the size of the loaded media is not the specified one, load correct media. If the operation is abnormal, replace the media sensor. 3 Replace the main controller PCB. 6.1.4.11 03130031260E Gap detection error 00137223. Printhead, head relay PCB, carriage relay PCB, carriage unit, or main controller PCB 1 Replace the printhead. 2 Cable continuity check If continuity of the cable between the head relay PCB and the carriage relay PCB is

abnormal, replace the cable. 3 Replace the Head relay PCB. Roll media, feed roller HP sensor, feed roller encoder film, feed roller encoder, or main controller PCB. Procedure 1 Start CARO Firmware Update Tool. 2 Place the printer in the online mode. 3 Transfer the firmware data to the printer according to the instructions shown on the display. Use photo glossy paper. By executing this mode, Backup data of the settings and counter values stored in the MC relay PCB are moved to the new main PCB. If an error occurs during printing, the printer status is also displayed on the status monitor of the printer driver. The following three types of errors are displayed on the display Warning Status where the print operation can be continued without remedying the cause of the problem. This page requires Javascript.
